

Forklift Training Course Regina

Forklift Training Course Regina - Industry and federal regulators have established the criteria for forklift safety training based on their existing standards and regulations. People wanting to operate a forklift should complete a forklift training course before using one of these machines. The accredited Forklift Operator Training Program is designed to offer individuals training with the knowledge and practical skills to become a forklift operator.

There are forklift operation safety rules that should be followed pertaining to pre-shift checks, and regulations for loading and lifting.

Prior to a shift starting, an inspection checklist has to be carried out and given to the Instructor or Supervisor. If any maintenance problem is discovered, the machine must not be utilized until the problem is dealt with. To indicate the machine is out of service, the keys must be removed from the ignition and a warning tag placed in a visible place.

Safety regulations for loading will consist of checking the forklift's load rating capacity to know how much the equipment can handle. When starting the machinery, the forks must be in the downward position. Don't forget that there is a loss of approximately 100 pounds carrying capacity for every one inch further away from the carriage which the load is carried.

To be able to safely lift a palletized load, drive the forklift to the pallet and halt with the fork three inches away from the load. Level the mast until it is at right angles to the load. Lift the forks to an inch underneath the slot on the pallet and drive forward. Next lift forks four inches. Tilt back the load to secure it for moving. Drive the lift backwards if the load obscures frontal vision. Check behind and honk to warn other staff. Never allow forks to drag on the ground.

Forklift loads must be loaded in such a way that they are secure and do not create a hazard to other people or objects. Restraining loads is needed for materials that may shift during transport and destabilize the forklift.

So as to prevent the movement of drums, drums can be strapped together to reduce movement. Forklift operators should drive slowly when moving liquids, to reduce instability in the forklift.
